

# Locating Nearby Hospital

---

# Introduction:

---

Now a days, at the time of medical emergency, it's too hard for locating the nearby Hospital, especially when you are in unknown city, town, place etc.

The main idea is to pick the location of the user and compare it with the location of the Hospitals from our datasets.

User will get this information on the single click

# Data:

---

[https://github.com/chinmay546/Coursera\\_Capstone/blob/master/hospital-locations.csv](https://github.com/chinmay546/Coursera_Capstone/blob/master/hospital-locations.csv)

I have converted this csv file into Data Frame using Python Library “Pandas”. It contains data such as: Name, Address, Zip code, Neighbor, X Co-ordinate, Y Co-ordinate of the Hospitals.

Previously, X Co-ordinate and Y Co-ordinate from the Dataset were in the following format:

# Final DataSet

---

	NAME	AD	ZIPCODE	NEIGH	XCOORD	YCOORD	Location
0	Lemuel Shattuck Hospital	170 MORTON ST	2130	ROSLINDALE	71.106033	-42.300022	170 MORTON ST\nROSLINDALE, MA 02130\n(42.30025...

# Methodology:

---

After cleaning data, we take input from the user. Here, I have inputted the co-ordinates.

```
from haversine import haversine, Unit

lyon = (71.074854, -42.335459) # (lat, lon)
a = float(input('Enter Latitude '))
b = float(input('Enter Longitude '))
c = []
c.append(a)
c.append(b)
c = tuple(c)
d = []
df1 = pd.DataFrame()
dist = []
for ind in df.index:
    x = df['XCOORD'][ind]
    y = df['YCOORD'][ind]
    d.append(x)
    d.append(y)
    d = tuple(d)
    dist.append(haversine(c,d))
    d = list(d)
    d.clear()
```

```
Enter Latitude 71.072040
Enter Longitude -42.336860
```

Basically, this compares the distance between the inputted co-ordinates and the co-ordinates from the dataset. List named 'dist' is created and further added as a column to the dataset.

	NAME	AD	ZIPCODE	NEIGH	XCOORD	YCOORD	Location	Distance
